

HOUSEHOLD OF KOREA : 1960—1966*

— Interim Report —

Hae Young Lee

Seoul National University

I. Major Sources of Household Data

Korea has a long history of “hojuck” (household registry) system for the purpose of military draft, tax, and labor services. During Yi Dynasty, last kingdom of Korea, “hojuck” system was quite effectively utilized and the number of households and population for the entire country were made available by this system. From its inception the Yi Dynasty carried out a compulsory household registration every three years. A copy of the registration was stored at the central government office at Hansung (Seoul) and other copies at provincial offices respectively.

The record sheet of the registration system included householdheads' address, occupation, name, date of birth, place of ancestor's origin, and names of four immediate ancestors (father, grand father, great grand father and mother's father). The registration also contains information on wife's maiden family name, year of birth, place of ancestor's origin, and names of wife's four immediate ancestors. It further asked children's years of birth, names of sons-in-law, and places of their ancestor's origin, and years of birth for servants and household employees. A substantial volume of record sheets of the registration are still preserved and these can be used as valuable sources of data for demographic and stratification study for the Yi-Dynasty. Of course there are many problems in the data and an extensive evaluation study is needed to reveal types and extent of errors in the data. Nevertheless, when the data are used with a special care, these could provide useful information on household and population of the Yi-Dynasty. One

* This is a revised version of a paper presented to the Organization of Demographic Associates' Workshop, Hong Kong, January 10—13, 1972.

study that made an extensive use of “hojuck” statistics estimates that the average size of household was 4.4 in Taegu area for the later part of the 16th century and 4.6 for the earlier part of the 18th century of Yi Dynasty.¹⁾

Since the beginning of the colonial period in 1910, the Government-General of Chosun had conducted the year-end household survey. Table 1 shows average number of persons in each household for the period of 1910—1940 based on the household survey. As shown in the table, the average size of household increased from 4.8 in 1910 to 5.4 in 1940.

Table 1. Average Size of Korean Households, 1910—1940

Year	Size	Year	Size
1910	4.77	1926	5.34
1911	4.92	1927	5.35
1912	5.05	1928	5.35
1913	5.12	1929	5.34
1914	5.15	1930	5.35
1915	5.27	1931	5.34
1916	5.31	1932	5.31
1917	5.35	1933	5.31

Source: Kim, Yun, *The Population of Korea, 1910—1945*, Unpublished Ph. D. Thesis at Australian National University, 1966, p. 288

The Government-General of Chosun originally planned to conduct the first census of Korea in 1920. However, the nationwide Sam-il Independent Movement of Korea on March 1, 1919 prevented the scheduled census. The first census was finally taken place in 1925. A total of five censuses were carried out until the end of the colonial period in 1925, 1930, 1935, 1940 and 1944. After the end of World War II, five censuses were carried out in 1949, 1955, 1960, 1966 and 1970. Only an advanced report was published

1) Shikata Hiroshi, “Richo Jinko ni kansuru Ichi Kyenkyu”(A Study on Population of Yi Dynasty) in *Chosen Shyakai Hosei Shi Kenkyu (Study on Korean Social and Legal History)* edited by Jurisprudence Association of Keijo(Seoul) Imperial University, Iwananai Shoten, Tokyo, 1938, p. 310

from the 1949 Census while the remaining 1949 Census data were completely destroyed during the Korean War. The 1955 Census was conducted in the period when the chaotic effects of the Korean War were still felt and accordingly the data contain many problems to be properly utilized for research and planning purposes. It was from the 1960 that the Korean census began to show substantial improvement both in quantity and quality.

II. Definition of Household

1. Definition: 1925—1944

In the censuses of 1925 through 1944, two types of households, ordinary household and quasi-household, were used without details of the definitions being substantially changed. According to the 1925 Census, household was defined as follows:

“Household is defined as a group of persons sharing living quarters and expenditures. Persons sharing living quarters but maintaining separate expenditures and those sharing living expenditures but maintaining separate living quarters are included in the household where they share one of the two items. A person maintaining an independent living quarter and living expenditures is also constituted a household. Places or institutions such as dormitories, hospitals, hotels, boarding houses, or ships where people are sharing living quarters but maintaining separate household expenditures are treated as ‘quasi-households’ respectively.”²⁾

2. The 1960 Census definition³⁾

(A) Household

Household is defined as a group of two or more persons sharing living quarters and living expenses, or a person who lives by himself and occupies a dwelling unit.

Households are classified as follows:

1. *Private Household*: A Private household is defined as a group of persons sharing living quarters and living expenses and includes lodgers and employees as in an ordinary home. Persons who are usually living in hotels, boarding houses and kindred are included in the private household when number of customers staying is less than five. One person living alone also constituted a private household.

2) Government-General of Korea, 1930 *Korean Census Report*, Vol. 1.

3) Economic Planning Board, 1960 *Population and Housing Census of Korea*, Vol. 1.

2. *Collective Household*: Collective household is a group of individuals, generally unrelated to each other kinshipwise and collectively sharing living quarters and living expenses. Dormitories, boarding houses, asylums, camps, monasteries, temples, etc. are included, irrespective of the number of persons accommodating. In hotels, lodging houses, inns, etc. persons who temporarily stay are excluded. In the case of persons who usually reside there, it is counted as a collective household, if there are 5 or more such persons.

Collective households were classified as follows:

- i) Hotels, boarding houses, inns, etc. where guests, temporary boarders etc. are accommodated.
- ii) Institutions: such public buildings as hospitals, dormitories, orphanages, asylums, temples, etc. built for public use.
- iii) Others: camps or tents built temporarily for living quarters.

3. *Farm Household*: Farm households are defined as those whose members cultivate directly by themselves farm lands such as fields, paddy fields, orchards, etc., amounting 300 pyeongs or more, regardless of its ownership status.

4. *Non-farm Household*: Non-farm households are defined as those other than farm households.

(B) Generations in Household

Generation refers to each lineage order among the direct line families or collateral families who are related to the head of household in a private household. For instance, if there are grand parent, parent and sons in one household, it corresponds to three generations.

3. The 1966 Census definition.⁴⁾

Household in the 1966 Census is defined as a person or a group of persons sharing living quarters and household expenditures. Two types of household are used for the census.

1. *Ordinary household*

An ordinary household is defined as a single person who is living by himself occupying a dwelling unit or a group of persons sharing living quarters and expenditures. Three types of ordinary household are used.

4) Economic Planning Board, 1966 *Population Census Report of Korea*, Vol. 1.

- a) household head and his family occupying a dwelling unit
- b) household head, his family, and others such as servants, boarders, employees and housemaids, sharing a common dwelling unit
- c) single person household with a separate kitchen facility.

2. *Quasi household*

A quasi household is defined as a person or a group of persons who are not related to each other kinshipwise but sharing living quarters.

- a) single person quasi household: a person sharing a living quarter with an ordinary household but maintaining a separate living expenditure.
- b) other quasi household: a group of six employees or more living with an ordinary household, persons staying in cooperatives, dormitories, hospitals, sanitariums, and beggars with no fixed residence. In-patients with less than three months of residence in hospital or sanitarium are not included in the quasi household.

The ordinary household is further classified as:

- (i) Classes of ordinary household
 - A. Relatives household: a household principally composed of family members and relatives.
 - a) relatives only-household composed of the head of household and his relatives.
 - b) household with home service workers: household consisting of household head, his(or her) family and relatives, and home-service workers.
 - c) household with business employees: household consisting of household head, his (or her) family and relatives, and business employees.
 - d) household consisting of the head, his(or her)family and relatives, house servants, and business employees.
 - B. Non-relatives household: household head and persons having no kinship relationship but living with the head such as house servants and business employees.
 - C. Single person household: household consisting of the head only.
- (ii) Family composition of the relatives household.

Relatives households are sub-classified according to the kinship relationship of the household members to the head of household.

 - A. One generation household:
 - 1) household consisting of husband and wife only.
 - 2) household consisting of husband and wife and his or her siblings.

3) household consisting of husband, wife, his or her cousins. This type may include husband's(or wife's) siblings.

B. Two generation household:

Household consisting of the head and his(or her) immediate children or nephews and nieces:

4) household consisting of husband, wife and their sons and/or daughters.

5) household consisting of husband, wife, their children and husband's(and/or wife's) siblings.

6) household consisting of father and his children.

7) household consisting of mother and her children.

8) household consisting of husband and wife and his(or her) parents. This type may include the husband's and/or wife's siblings.

9) household consisting of husband and wife and his(or her) father or mother.

10) household consisting of husband and wife and their nephews and nieces or their uncles.

C. Three generation household: Household consisting of three generations.

11) household consisting of husband, wife, their children and parents. This class may include husband and wife's siblings.

12) household consisting of husband, wife, their children and one of their parents. This class may include the couple's siblings.

13) household consisting of husband, wife, one of their parents, children, grand children. Households consisting of non-immediate three generation family members are included in this class.

D. Other types of relatives-household:

Four or more generation households: This type may include incomplete four generation households in which one or two intermediate generations are missing. Classification of the relatives household is based on generational composition of the family regardless the existence of other residents such as house servants, business employees, and other non-relative co-residents.

(iii) Economic composition of ordinary household:

The ordinary household is classified according to the working status and industry of the relatives as follows:

A. Household in which all the employed are engaged in agriculture, forestry and fishery.

- 1) Household with the holder working for his own account in agriculture, forestry and fishery.
 - 2) Household with the holder employed in agriculture, forestry and fishery.
- B. Household mixed with agricultural and non-agricultural workers: Household being consisted of both agricultural and non-agricultural workers.
- 3) Household mixed with the holder working for his own account in agriculture, forestry and fishery.
 - 4) Household mixed with household members employed in agriculture, forestry and fishery.
 - 5) Household mixed with the holder working for his own account in non-agriculture.
 - 6) Household mixed with household members employed in non-agriculture.
- C. Non-agricultural workers' household: Household in which all of the employed are engaged in non-agricultural industry.
- 7) Household with the holder working for his own account in non-agricultural industry.
 - 8) Household with the holder employed in non-agricultural industry.
 - 9) Household mixed with the holder working for his own account and household members employed in non-agricultural industry.
 - 10) Household mixed with the holder employed and household members working for their own accounts in non-agricultural industry.
- D. Household without workers.

As shown in the household concepts described above, a household has been basically defined as "a group of persons sharing living quarters and expenditures or a person maintaining an independent living quarter and living expenditure" and classified into two types, ordinary household and quasi household, throughout the censuses of the Korea since 1925 except for the 1960 Census in which the household was classified as private household and collective household, which are generally equivalent to the ordinary and quasi household in other censuses. However, there are some differences in the details of classification of household from census to census especially between the 1960 and 1966 Censuses. The main differences are described below.

1) In the 1960 Census, as in the previous censuses, a person living in a private household and maintaining an independent living expenditure was treated as an ordinary household. In the 1966 Census, however, an additional category of one-person household was used; that is, a person sharing a living quarter with an ordinary household

but maintaining a separate living expenditure was treated as a single person quasi-household and included in the "quasi household".

2) In the 1960 Census, live-in employees and lodgers in an individual household were treated as members of ordinary households which they are residing with regardless of their size. On the other hand, the 1966 Census defined a group of 6 live-in employees (or lodgers) or more residing in an ordinary household as "other quasi-household".

3) For the first time in the 1966 Census, ordinary household was sub-classified into "relatives household", "non-relatives household", and "single person household", and they were tabulated in such a manner that the average number of household members for each type was identified.

III. Household Size

Partition of the country into two parts, North and South Korea, at the end of World War II made it difficult to compare the population statistics compiled during the colonial period with those collected after the War due to changes in boundaries and in definitions used for the censuses. Since the War, compilation of population statistics has been confined to the southern half of the country and statistics for the North Korea have not been available. Therefore, the present analysis will be focused upon the data from the 1960 and 1966 censuses covering the South Korea only.

As shown in Table 2, the total number of households increased 18 percent from 4,378,000 in 1960 to 5,133,000 in 1966. In both censuses, the proportion of quasi-households was less than one percent even though the proportion has increased slightly in urban areas during the 1960—1966 intercensal period. For this reason, this study is confined to the analysis of ordinary households only.

One distinct feature of the Korean household scene during the 1960—1966 intercensal period is a complete reversal of the proportion of farm and non-farm household. Table 3 shows that the proportion of farm household decreased from 54 percent to 45 percent and that of non-farm household increased from 46 percent to 55 percent during the period. This means that more than half of the total ordinary households were non-farm households by 1966. It would appear that the large magnitude of migration from rural farm areas to rural non-farm and urban areas accounts for this change. The proportion of farm households in urban areas did not change significantly during the 1960—1966

Table 2. Percent Distribution of Households by Household type

	Total Household		Ordinary Household ¹⁾ (Private Household)		Quasi Household (Collective Household)		Unknown	
	No.	%	No.	%	No.	%	No.	%
<u>1960</u>

Urban	1,260,782	100.00	1,251,927	99.30	8,124	0.64	731	0.06
Rural	3,117,191	100.00	3,109,497	99.75	6,891	0.22	803	0.03
<u>1966</u>								
Whole Country	5,132,910	100.00	5,057,030	98.52	75,880	1.48		
Urban	1,858,660	100.00	1,812,890	97.54	45,770	2.46		
Rural	3,274,250	100.00	3,244,140	99.08	30,110	0.92		

Source:

1960: 1960 *Population and Housing Census of Korea*, 11-1 *Whole Country*, Vol. I, Economic Planning Board, Seoul, Korea, 1963, Table 2

(1) The total number of ordinary households here is based on 100 percent count and slightly different from that in other tables based on a 20 percent sample estimate.

1966: 1966 *Population Census Report of Korea*, 12-1 *Whole Country*, Economic Planning Board, Seoul, Korea, 1969, Table 14.

period. However, the proportion of farm household in rural areas changed substantially from 72 percent in 1960 to 65 percent in 1966. It may be hypothesized that the process of industrial development and an increasing income gap between farm and non-farm sectors during the period may have affected the substantial decrease in the proportion of farm-household in rural Korea. The decrease in the proportion of farm household in rural areas also may be accounted for by a substantial number of migrants from rural farm areas to small towns and middle towns which are classified as rural areas in the census. Rural areas as defined in the censuses include administrative centers of Eups and Myuns, that are often closer to urban areas in nature. Re-examination of urban definition used in the censuses is needed for a sound analysis of rural-urban transition in Korea.

As indicated previously, average number of household members has continuously increased in Korea. The number of household members averaged about 4.6 persons in the early part of the 17th century and 4.8 in 1910. According to data from the censuses, the average size of household was 5.25 persons in 1925, 5.26 in 1930. The increasing trend of household size continued until 1960, by which the average size reached 5.55 persons. This trend has been reversed slightly during the 1960-1966

period, and the average size declined to 5.49 persons by 1966 as shown in Table 4.

Table 3. Percent Distribution of Households by Farm and Non-Farm Category for Whole Country, Urban and Rural Areas, 1960-1966

	1960 ¹⁾		Total	1966 ²⁾		Total
	Farm Households (%)	Non-Farm Households (%)		Farm Households (%)	Non-Farm Households (%)	
Urban Areas	8.41	91.59	100.00 (n=1,254,335)	8.86	91.14	100.00 (n=1,812,890)
Rural Areas	71.92	28.08	100.00 (n=3,100,880)	65.25	34.75	100.00 (n=3,244,140)
Total	53.63	46.37	100.00 (n=4,355,215)	45.04	54.96	100.00 (n=5,057,030)

Source (1): 1960 *Population and Housing Census of Korea*, Vol. 2, 20% Sample Tabulation Report, 11-1 Whole Country, Economic Planning Board, Seoul, Korea, 1963, Table 7

(2): 1966 *Population Census Report of Korea*, 12-1 Whole Country, Economic Planning Board, Seoul, Korea, 1969, Table 16

Table 4. Average Number of Ordinary Household Members, Whole Country, Urban and Rural Areas, 1930, 1960 and 1966

	Households	Persons	Average
1930			
Whole Country	3,957,111	20,814,103	5.26
Urban	238,361	1,121,990	4.71
Rural	3,718,750	19,692,113	5.30
1960			
Whole Country	4,357,600	24,188,800	5.55
Urban	1,255,275	6,712,730	5.35
Rural	3,102,325	17,476,070	5.63
1966			
Whole Country	5,057,030	27,765,620	5.49
Urban	1,812,890	9,267,560	5.11
Rural	3,244,140	18,498,060	5.70

In Table 5, we find that the decline was experienced both in the farm and non-farm households except in rural non-farm households. The decline in the household size may be due to the decline in the fertility rate of the Korean population and heavy rural to-urban migration during the period. When the 1970 Census results are published, more-detailed analysis on the factors relating to the decline in the household size will be possible.

Table 6 shows the percentage distribution of household by size for the entire country, urban and rural areas respectively in 1960 and 1966. The corresponding figure for 1930 is also presented as a reference. During the 1960-1966 period the proportions of 1 to 2 person households and 6 to 9 person households showed an increase and those of 3 to 5 person households and 10 or more person households revealed a decline for the country as a whole. For urban areas the proportions of 1 to 3 person households, especially those of 1 to 2 person households increased significantly during 1960-1966. Households with 4 to 5 persons maintained more or less same proportion and a sharp decline was experienced for households with 7 persons or more. In other words, urban households underwent a generally declining trend toward those with less than five members during the period. On the other hand, the size of rural households in general expanded during the period. In rural areas, the proportion of household with 1 or 2 persons increased slightly as in urban areas and those with 3 to 5 persons declined substantially for the same period. However, the proportion of households with 6 to 9 persons sharply increased in rural areas. As in urban areas, households with 10 or more persons experienced a loss in the proportional share in rural areas.

In table 7, the household size is classified into 1 to 2 person, 3 to 5 person, 6 to 9 person and 10 or more person households. The table clearly illustrates that in urban areas, small size households with 1 to 2 persons and 3 to 5 persons increased substantially while those with 6 to 9 persons declined during the intercensal period. In rural

Total	100.00	100.00	100.00	100.00	100.00	100.00		

areas, on the other hand, households with 3 to 5 persons declined proportionally while those with 6 to 9 persons increased. As a result, almost 60 percent of the urban households were those 5 persons or less and more than 50 percent of the rural households were those with 6 persons or more in 1966. It would appear that the changing value system of the urban population towards a smaller family size and the large number of relatively young migrants towards urban areas probably caused this decreasing trend of urban household size.

IV. Family Size and Composition

In the 1960 Census report, ordinary households were tabulated according to the generation type. In the 1966 census report, relatives households were separately tabulated under the ordinary household for the first time in Korea and it became possible to study the family composition and size from the census data.

Table 8 compares the composition of ordinary households by generation type between 1960 and 1966 censuses. In 1960, the proportion of two generation family was 64 percent and that of the three generation family was 27 percent. In 1966, the proportion of the two generation family increased to 68 percent and that of the three generation family declined to 24 percent respectively. Even though the two and three generation families constitute the majority for both censuses, the two generation family tended to increase while the three generation family tended to decline during the 1960—1966 period.

Table 8. Percent Distribution of Relatives Households by Household Type, 1960—1966

Household Type	1960 ¹⁾	1966 ²⁾
One-Generation Households	7.48	5.67
Two-Generation Households	63.88	67.68
Three-Generation Households	26.99	24.05
Other Relatives Households	1.59	2.60
Unknown	0.06	—
Total	100.00 (n=4,357,600)	100.00 (n=4,900,650)

Source (1): 1960 *Population and Housing Census of Korea*, Vol. 2, 20% Sample Tabulation Report, 11—1 *Whole Country*, Economic Planning Board, Seoul, Korea, 1963, Table 7

(2): 1966 *Population Census Report of Korea*, 12—1, *Whole Country*, Economic Planning Board, Seoul, Korea, 1969, Table 16

Table 9 shows the family composition by generation for urban and rural areas in 1960 and 1966. In both censuses, the proportions of the two generation family were higher for urban areas and those of the three generation family were higher for rural areas. In urban areas the proportion of the two generation family increased from 71 percent in 1960 to 74 percent in 1966 and that of the three generation family declined from 19 percent to 16 percent for the same period. In rural areas, the proportion of the two-

generation family increased from 61 percent in 1960 to 64 percent in 1966 and that of the three generation family declined from 30 percent to 29 percent during the period. This means that even if in both urban and rural areas the two generation household is gaining its proportional share and three generation household is losing, one third of the total families in rural areas are still composed of three generation in Korea as of 1966.

Table 9. Percent Distribution of Relatives Households by Household Type, Urban and Rural areas, 1960—1966

Household Type	Urban Areas		Rural Areas	
	1960 ¹⁾	1966 ²⁾	1960 ³⁾	1966 ⁴⁾
One-Generation Households	9.29	8.09	6.75	4.34
Two-Generation Households	71.43	74.28	60.82	64.06
Three-Generation Households	18.53	15.92	30.41	28.51
Other Relatives Households	0.55	1.71	2.02	3.09
Unknown	0.20	—	0.00	—
Total	100.00 (n=1,255,275)	100.00 (n=1,735,430)	100.00 (n=3,102,325)	100.00 (n=3,165,220)

Source (1), (3): 1960 *Population and Housing Census of Korea*, Vol. 2, 20% *Sample Tabulation Report*, 11—1 *Whole Country*, Economic Planning Board, Seoul, Korea, 1963, Table 7

(2), (4): 1966 *Population Census Report of Korea*, 12—1 *Whole Country*, Economic Planning Board, Seoul, Korea, 1969, Table 16

According to the 1966 Census, the proportion of relatives households in the ordinary households was 95 percent for the entire country, 95 percent for urban areas, and 97 percent for rural areas. The 1966 Census report classified the relatives households into the following 14 categories: (A) One generation household: (1) married-couple only, (2) married couple and brother(s) and/or sister(s), (3) other one-generation household. (B) Two generation household: (1) married couple with child(-ren), (2) married couple with children and brother(s) and/or sister(s), (3) husband and child(ren), (4) wife and child(ren), (5) married couple without child(ren) and their parents, (6) married couple without child(ren) and a parent, (7) other two generation household. (C) Three generation household: (1) married couple with child(ren) and parents, (2) married couple with child(ren) and a parent, (3) other three generation household. (D) Other relatives household such as four generation or more household or grand parents with grand sons etc..

In Table 10 “husband and child(ren)” and “wife and child(ren)” are presented into one category and “married couple with child(ren) and parents” and “married couple with child(ren) and a parent” are put together. In this table we can see that, in 1966,

nuclear families consisting of a couple and their children constituted 54 percent of the relatives households. Three generation households consisting of a couple, their children, and their parents(or one of their parents) constituted another 24 percent of the total relatives households.

Table 10. Relatives Households by Household Type, 1966

(number in 1,000)

Household Type	Number	%
1) One-Generation Households	277	5.67
Married Couple Only	224	4.57
Married Couple and Brothers or Sisters	13	0.28
Other One-Generation Households	40	0.82
2) Two-Generation Households	3,316	67.68
Married Couple with Children	2,655	54.18
Couple with Children and Brothers and/or Sisters	101	2.08
Husband and Children or Wife and Children	394	8.05
Married Couple without Children and Their Parents or a Parent	69	1.42
Other Two-Generation Households	95	1.95
3) Three-Generation Households	1,178	24.05
Married Couple with Children and Their Parents or a Parent	971	19.83
Other Three-Generation Households	207	4.22
4) Other Relatives Households	127	2.60
Total	4,900	100:00

Source: 1966 *Population Census Report of Korea, 12-1 Whole Country*, Economic Planning Board, Seoul, Korea, 1969, Table 16

The contrast in family composition between urban and rural areas is clearly shown in table 11.

The nuclear family constituted 57 percent of the total urban relatives households and 53 percent of the total rural relatives households. While 13 percent of the urban relatives households were three generation families of couple with children and their parents or one of parents, 24 percent of the rural relatives households belonged to this category.

Table 12 shows a cumulative percent distribution of the two and three generation households by the number of persons. A slightly more than half of the two generation households are composed of 5 percents or less. In urban areas two generation households with 5 or less persons constitute 56 percent while the rural counterparts constitute 51 percent. It is also shown in the table that the three generation households tend to be smaller in size in urban areas than in rural areas.

Table 11. Relatives Households by Household Type, Urban and Rural Areas, 1966
(number in 1,000)

Household Type	Urban Areas		Rural Areas	
	Number	%	Number	%
1) One-Generation Households	140	8.09	137	4.34
Married Couple Only	99	5.72	124	3.94
Married Couple and Brother(s) or Sister(s)	9	0.53	4	0.14
Other One-Generation Households	32	1.84	8	0.26
2) Two-Generation Households	1,289	74.28	2,027	64.06
Married Couple with Children	993	57.24	1,661	52.50
Married Couple with Child(ren) and Brother(s) and/or Sister(s)	60	3.49	41	1.31
Husband and Children or Wife and Children	164	9.45	230	7.28
Married Couple without Children and Their Parents or a Parent	20	1.16	49	1.57

V. Summary

Following tentative conclusions may be derived from the present analysis.

(1) The average size of Korean household had been gradually growing for the past several centuries. During the 1960—1966 period, this increasing trend changed its course and the family size revealed a decline.

(2) During the 1960—1966 period, the proportion of non-farm households increased and surpassed that of farm households.

(3) Even though two generation households (including nuclear family) constitute a majority both in rural and urban area, the proportion of the three generation households is still quite substantial in rural areas.

(4) A large proportion of the two generation households is still composed of large families in its size. The two generation households are, however, distributed widely between 3 to 7 member households, which may be viewed as a transitional phenomenon in the modernization process of the Korean family.
